Treatment Intervention Advisory Committee Review and Determination

Date: October 30, 2015
To: DHS/DLTC
From: Wisconsin Department of Health Services Autism and other Developmental Disabilities
Treatment Intervention Advisory Committee: Lana Collet-Klingenberg, Ph.D. (chairperson)
RE: Determination of Sensory Integration Therapy as a proven and effective treatment for individuals with autism spectrum disorder and/or other developmental disabilities

☐ This is an initial review
☒ This is a re-review. The initial review was November 2013.

Section One: Overview and Determination

Please find below a statement of our determination as to whether or not the committee views Sensory Integration Therapy as a proven and effective treatment for children with autism spectrum disorder and/or other developmental disabilities. In subsequent sections you will find documentation of our review process including a description of the proposed treatment, a synopsis of review findings, the treatment review evidence checklist, and a listing of the literature considered. In reviewing treatments presented to us by DHS/DLTC, we implement a review process that carefully and fully considers all available information regarding a proposed treatment. Our determination is limited to a statement regarding how established a practice is in regard to quality research. We do not make funding decisions.

Description of proposed treatment
Sensory Integration Therapy has previously been defined by the President of the American Occupational Therapy Association as follows: “Sensory integration therapy (SIT), as originally described by A. Jean Ayres (1975, 1979), represents a neuroscientifically based therapeutic approach for treating children with ASD. The aim of SIT is to promote the child's ability to organize increasingly complex, successful adaptive responses (Ayres, 1972). To be correctly labeled as SIT an intervention must meet the following criteria, as described in the Ayres Sensory Integration Fidelity Measure (Parham et al., 2007; Parham et al., 2011): (a) assurance of physical safety; (b) presentation of multimodal sensory opportunities; (c) maintenance of appropriate levels of alertness; (d) challenge to postural, ocular, oral, or bilateral motor control; (e) challenge to praxis and organization of behavior; (f) therapist-child collaboration in activity choice; (g) tailoring of activity to present a "just-right" challenge; (h) assurance that the therapeutic activities successfully engage the child; (i) support of the child's intrinsic motivation to play; and (j) establishment of a therapeutic alliance. The American Occupational Therapy Association (AOTA) recognizes SIT as one of many treatment approaches used by occupational therapists working with children ASD. When providing SIT, the therapist may utilize sensory-based modalities (e.g., a pressure vest) or recommend specific sensory strategies, but unless these procedures are embedded in a multifaceted treatment plan that adheres to the above criteria (including the presentation of multi-modal sensory opportunities), the approach cannot appropriately be described as SIT. SIT is provided utilizing a direct one-on-one intervention model in a clinic environment that contains specialized equipment (e.g., suspended swings) capable of providing graduated and varied forms of multisensory input. Treatment
sessions last approximately 30 minutes to one hour, one to three times per week. Ideally, SIT should be administered for a minimum of several weeks.”

Synopsis of review
In the case of Sensory Integration Therapy, please refer to the attached reference listing that details the reviewed research. The committee’s conclusions regarding Sensory Integration Therapy include:

- A literature search was conducted for 2015 in order to find studies that have been published since the last review. Two new research articles were found and article inclusion checklists completed. An article from Focus on Autism and Other Developmental Disabilities, titled "Investigating the Effects of Sensory Integration Therapy in Decreasing Stereotypy" by Sniezyk and Zane (2015) concluded that "the research that exists on testing the effectiveness of SIT is at best inconclusive, at worst showing thus far that it is not an effective treatment strategy."
- This article was a well designed, experimental study with interobserver agreement and procedural validity built in. The authors were unable to demonstrate that SIT was effective in reducing stereotypical behavior.
- Another study from the journal Behavioral Interventions titled, "Sensory Integration as a Treatment for Automatically Maintained Stereotypy" by Moore, Cividini-Motta, Clark and Ahearn (2015) also concluded that SI had no impact on the target behavior.
- Both of these articles underscore concerns from the field, including those in the field of Occupational Therapy (e.g., Parham et al, 2007), regarding the lack of evidence to support SIT as an evidence-based practice. As noted in a personal communication from AOTA, dated June 7, 2013, authoritative bodies such as the National Autism Council, AHRQ, and the Rand Corporation also find inconclusive evidence regarding SIT as an evidence-based practice.

In sum, it is the decision of the committee that Sensory Integration Therapy, remain at Level 4-Insufficient Evidence.
Section Two: Rationale for Focus on Research Specific to Comprehensive Treatment Packages (CTP) or Models

In the professional literature, there are two classifications of interventions for individuals with Autism Spectrum Disorder (National Research Council, 2001; Odom et al., 2003; Rogers & Vismara, 2008):

(a) **Focused intervention techniques** are individual practices or strategies (such as positive reinforcement) designed to produce a specific behavioral or developmental outcome, and

(b) **Comprehensive treatment models** are “packages” or programs that consist of a set of practices or multiple techniques designed to achieve a broader learning or developmental impact.

To determine whether a treatment package is proven and effective, the Treatment Intervention Advisory Committee (TIAC) will adopt the following perspective as recommended by Odom et al. (2010):

The individual, focused intervention techniques that make up a comprehensive treatment model may be evidence-based. The research supporting the effectiveness of separate, individual components, however, does not constitute an evaluation of the comprehensive treatment model or “package.” The TIAC will consider and review only research that has evaluated the efficacy of implementing the comprehensive treatment as a package. Such packages are most often identifiable in the literature by a consistently used name or label.

Section Three: DLTC-TIAC Treatment Review Evidence Checklist

Name of Treatment: Sensory Integration Therapy

Level 1 - Well Established or Strong Evidence (DHS 107 - Proven & Effective Treatment)

☐ Other authoritative bodies that have conducted extensive literature reviews of related treatments (e.g., National Standards Project, National Professional Development Center) have approved of or rated the treatment package as having a strong evidence base; authorities are in agreement about the level of evidence.

☐ There exist ample high quality studies that demonstrate experimental control and favorable outcomes of treatment package.
  ☐ Minimum of two group studies or five single subject studies or a combination of the two.
  ☐ Studies were conducted across at least two independent research groups.
  ☐ Studies were published in peer reviewed journals.

☐ There is a published procedures manual for the treatment, or treatment implementation is clearly defined (i.e., replicable) within the studies.

☐ Participants (i.e., N) are clearly identified as individuals with autism spectrum disorders or developmental disabilities.

Notes: At this level, include ages of participants and disabilities identified in body of research

Level 2 – Established or Moderate Evidence (DHS 107 - Proven & Effective Treatment)

☐ Other authoritative bodies that have conducted extensive literature reviews of related treatments (e.g., National Standards Project, NPDC) have approved of or rated the treatment package as having at least a minimal evidence base; authorities may not be in agreement about the level of evidence.

☐ There exist at least two high quality studies that demonstrate experimental control and favorable outcomes of treatment package.
  ☐ Minimum of one group study or two single subject studies or a combination of the two.
  ☐ Studies were conducted by someone other than the creator/provider of the treatment.
  ☐ Studies were published in peer reviewed journals.

☐ Participants (i.e., N) are clearly identified as individuals with autism spectrum disorders or developmental disabilities.

Notes: At this level, include ages of participants and disabilities identified in body of research
Level 3 – Emerging Evidence (DHS 107 – Promising as a Proven & Effective Treatment)

☐ Other authoritative bodies that have conducted extensive literature reviews of related treatments (e.g., National Standards Project, NPDC) have recognized the treatment package as having an emerging evidence base; authorities may not be in agreement about the level of evidence.
☐ There exists at least one high quality study that demonstrates experimental control and favorable outcomes of treatment package.
☐ May be one group study or single subject study.
☐ Study was conducted by someone other than the creator/provider of the treatment.
☐ Study was published in peer reviewed journal.
☐ Participants (i.e., N) are clearly identified as individuals with autism spectrum disorders or developmental disabilities.

Notes: At this level, include ages of participants and disabilities identified in body of research

Level 4 – Insufficient Evidence (Experimental Treatment)
☒ Other authoritative bodies that have conducted extensive literature reviews of related treatments (e.g., National Standards Project, NPDC) have not recognized the treatment package as having an emerging evidence base; authorities are in agreement about the level of evidence.
☒ There is not at least one high quality study that demonstrates experimental control and favorable outcomes of treatment package.
☒ Study was conducted by the creator/provider of the treatment.
☐ Study was not published in a peer reviewed journal.
☐ Participants (i.e., N) are not clearly identified as individuals with autism spectrum disorders or developmental disabilities.

Notes:
**Level 5 – Untested (Experimental Treatment) &/or Potentially Harmful**

- Other authoritative bodies that have conducted extensive literature reviews of related treatments (e.g., National Standards Project, NPDC) have not recognized the treatment package as having an emerging evidence base; authorities are in agreement about the level of evidence.
- There are no published studies supporting the proposed treatment package.

- There exists evidence that the treatment package is potentially harmful.
  - Authoritative bodies have expressed concern regarding safety/outcomes.
  - Professional bodies (i.e., organizations or certifying bodies) have created statements regarding safety/outcomes.

*Notes:* At this level, please specify if the treatment is reported to be potentially harmful, providing documentation

Date: October 30, 2015

Committee Members Completing Initial Review of Research Base: Lana Collet-Klingenberg, Julie LaBerge

Committee Decision on Level of Evidence to Suggest the Proposed Treatment is Proven and Effective: Level 4- Insufficient Evidence
